

FINAL TECHNICAL ARCHITECTURE & SCOPE REALIZATION

Custom Hyperlocal & Multi-Store Routing Integration Profile for ommall.in

Project Domain:	ommall.in (Book Distribution Network)	Estimated Budget:	₹1,00,000 (Excluding GST)
Lead Architect:	Rohidas (PHP / Laravel Specialist)	Fulfillment Timeline:	8 – 10 Working Days
Integration Vendor:	Webkul / Bagisto Team (Sourav Pathak)	Scope Sign-off Date:	July 11, 2026

1. CONSOLIDATED LOGISTICS ROUTING MATRIX

The customized logistics framework resolves the operational workflow required to seamlessly coordinate multi-point retail physical assets across Karnataka without breaking standard storefront global inventory viewing paths.

Confirmed Functional Routing Constraints:

- **Catalog Global Access:** Customers retain search capability for the full consolidated title database regardless of geographical distance parameters.
- **Single Stock Point Fulfillments:** If an ordered quantity or title line matches an independent local node inventory (e.g., Udupi storefront), fulfillment routes locally to initiate immediate, manual same-day local distribution.
- **Split Inventory Consolidated Fallback:** If an order contains multi-line products distributed across different local branches, the platform forces a central fulfillment fallback via the main Bangalore default warehouse to prevent fragmented shipping items and additional user costs.

2. API CUSTOMIZATION BOUNDARIES & REFERENCE LINKS

Automation Layer Target	Integration Parameter Specifications & Endpoints
Third-Party Shipping API	Automates three core transaction processes natively: 1) Real-time shipping rate calculations at checkout, 2) Tracking ID generation logs, and 3) Shipping label generation via the Blue Dart API engine .
Baseline System Requirements	Production server validation requirements must satisfy baseline infrastructure specifications: https://devdocs.bagisto.com/getting-started/before-you-start.html
Shared Blueprint Scope Doc	Official engineering specification workflow document confirmed by technical partners: Google Doc Workflow Blueprint Asset

3. COMPLETE CHRONOLOGICAL CONSULTATION LOG

SESSION I: ARCHITECTURE SCALING & DISCOVERY (JULY 8, 2026)

Bagisto Team 11:04 AM	Hi Rohidas. Greetings from Bagisto team! We have received your required to check the demo of Bagisto quick commerce. You can check the demo here - https://demo.bagisto.com/commercia-retail/
Rohidas 11:05 AM	Hi. Ok. thank you for the quick response.
Bagisto Team 11:06 AM	<i>[Image Omitted]</i> Click on the Instant sandbox and your demo will be ready.
Rohidas 11:06 AM	I would like to see your quick commerce admin panel.
Bagisto Team 11:06 AM	Yes, it is available inside the demo. You can be able to see that.
Rohidas 11:07 AM	Okay. let me check it out.
Bagisto Team 11:07 AM	This is the admin panel link: https://demo.bagisto.com/commercia-retail-24052039827a82/admin/login
Rohidas 11:08 AM	Yes. I have already seen the B2C admin panel. I want to view the 'Quick Commerce' panel or options.
Bagisto Team 11:12 AM	Under the configuration, you can see the "Hyperlocal" settings, from here, the admin can add the google apis key with Radius. <i>[Image Omitted]</i>
Rohidas 11:13 AM	I saw it yesterday. I have enabled the hyperlocal settings via the configuration menu.
Bagisto Team 11:13 AM	At the front-end, the customer will select his location and if lies in the radius, he can be able to see the admin products. This functionality is currently available for quick commerce.
Rohidas 11:14 AM	Okay. I wil check it out. ommall.in — This client wanted a new online store website featuring quick commerce capabilities and PIN-code-based delivery. That is why I am looking for a PHP-based e-commerce platform.
Bagisto Team 11:19 AM	Okay, so, client may want capabilities specific to his business needs. Our solution will be suitable to him to start with the basic functionalities. On top of that, any sort of customization can be done as you will get the complete source code. Either your team can do the customization, or you can hire our resources for the same.

Rohidas 11:21 AM	Is the entire project open source? His store is located in Bengaluru. He intends to stock his books in shops across Karnataka and sell them through quick-commerce platforms.
Bagisto Team 11:23 AM	Yes, once you purchase the solution, you will get the complete source code and can create additional custom-packages as per the requirements. Yes, this is possible with the solution as the admin can create Categories, Product, etc from the backend and set his radius. From the front-end, customers can enter their location and can see the listed products and purchase them with already integrated payment solutions. You can check and proceed with this solution - https://bagisto.com/en/quick-commerce/
Rohidas 11:30 AM	Ok. Is it enough if I buy only quick commerce for my need? Its price is \$199, excluding GST, right? I am unable to select my location in the Quick Commerce front end store. I can type, but the location marker is not appearing.
Bagisto Team 11:34 AM	I have already mentioned you with the existing features of the solution. On top of that, if you needed any other feature, that needs to be customized. Do you have your in-house development team? You can check the complete features guide here - https://webkul.com/blog/bagisto-quick-commerce-documentation/
Rohidas 11:35 AM	I have knowledge of PHP, MySQL, React, and so on. Is a testing required to host online?
Bagisto Team 11:37 AM	The solution will be required to host online to go live. Either you can self-host the solution or you can proceed with our hosting plans - https://bagisto.com/en/cloud-hosting/ . It will work once the valid Google api keys will be entered by the admin.
Rohidas 11:40 AM	Can you explain more about this? Look, if there are many local centers in our state stocking books, how are we supposed to manage this through your 'Q-commerce'?
Bagisto Team 11:43 AM	You mean for the same admin having multiple inventory sources (warehouses)?
Rohidas 11:44 AM	If a buyer purchases a book from Udupi, the shop owner in Udupi receives a notification and delivers the book.
Bagisto Team 11:45 AM	Do you want the solution to have multiple sellers? each seller can manage their own listing and sell to the customers? just like amazon?
Rohidas 11:46 AM	It is owned by an individual, but they place their books in other local shops.
Bagisto Team 11:46 AM	Can I call you now?
Rohidas 11:48 AM	Do you have video tutorials for the admin panel that explain how your quick commerce system works?

Bagisto Team 11:48 AM	We do have a detailed written user guide here - https://webkul.com/blog/bagisto-quick-commerce-documentation/
Rohidas 11:48 AM	I will contact my clients first, then we can talk. Can i contact you later with this number for queries ?
Bagisto Team 11:49 AM	Sure. You can check with your client all the details and later we can connect and guide you with the most suitable solution.
Rohidas 11:50 AM	Is there a solution for this? Okay.
Bagisto Team 11:50 AM	Yes definitely. This is our official number and multiple team members are available on it. I need to have a call with you first to understand the requirements in detail. So, once we will connect, I will guide you further.
Rohidas 11:52 AM	As for the front-end, can we create a separate website developed to our needs? Okay. Are the hyper-local settings in the admin panel available to check after you disconnect from the chat?
Bagisto Team 11:54 AM	Current setup is like this - Backend - Laravel (PHP framework) Front-end - Vue.js+Tailwind CSS+Blade components. The demo is live with dynamic data. You can check whenever you want.
Rohidas 11:56 AM	I have basic to intermediate knowledge of Laravel. I know React and Tailwind for the front-end. Okay. Okay. Okay Sourav, I will contact your team after discussing this with my client.
Bagisto Team 11:59 AM	Sure Rohidas.
Rohidas 11:59 AM	Can we create data for up to 100,000 books in the store?
Bagisto Team 12:03 PM	Yes, easily. The solution is tested with 10 million+ SKUs and worked well. Just make sure to have these server requirements fulfilled - https://devdocs.bagisto.com/getting-started/before-you-start.html
Rohidas 12:05 PM	Ok. What are the charges on a monthly and hourly basis?
Bagisto Team 12:10 PM	2500 INR per hour for hourly. If you hire a dedicated developer for one complete month, it will cost you - 3,00,000 INR.
Rohidas 12:11 PM	OK

SESSION II: HYPERLOCAL ROUTING CONSTRAINTS (JULY 8, 2026 AFTERNOON)

Rohidas 03:23 PM	Hi, I need to know if a specific feature is available or how I can set it up. I want to know if Bagisto can do this: 1. I have multiple book stores (stock points) across Karnataka. 2. My main store is in Bangalore. 3. When a buyer visits the site, they must enter their Pincode. 4. If their Pincode is near any of my local stores, the book should be delivered same-day from that local store. 5. If their Pincode is not near any local store, the book will be sent via normal courier from my main Bangalore store. Is this Pincode-based stock and delivery routing feature available out-of-the-box in the Bagisto Quick Commerce Platform? If it is not built-in, can you please tell me how I can handle this? Is there an extension or module I can buy for this?
Bagisto Team 03:45 PM	Hi
Rohidas 03:46 PM	hi
Rohidas 03:49 PM	Hello, is this Sourav Pathak? Could you please confirm this?
Bagisto Team 03:51 PM	yes we are checking it and will update you.
Rohidas 03:52 PM	Okay
Bagisto Team 04:33 PM	how you are looking to do the delivery ? is it manual or would you be using any third party courier services
Rohidas 04:34 PM	Both types
Bagisto Team 04:35 PM	which third party you will use? cuz then we need to integrate the API for the same
Rohidas 04:35 PM	ex: bluedart
Bagisto Team 05:17 PM	and how you will define which one you will deliver manually and which one by bluedart, is it like local one will be done by you and the one outside the radius will be done by bluedart
Rohidas 05:19 PM	Hand-delivered: local distribution. yes.

Bagisto Team 07:22 PM	Hi Rohidas, the shipping part is something that will be custom developed as it requires integration. Right now the default flow is: A. Setup (Done Once by Admin) • Add each physical bookstore as an Inventory Source (stock point) in Bagisto admin. • Set each store's location (latitude/longitude) and its stock. • Mark your Bangalore store as the main store. • Set the service radius (e.g. 10 km) in Configuration → Hyperlocal → Settings. B. Buyer Places an Order (Storefront) • Buyer opens the website. • Buyer sets their location (area/pincode, GPS, or saved address). • System finds the nearest local store within the service radius. • Books in stock at that store are shown. • Buyer adds books to cart and checks out. • Order is placed successfully. Right now this is the default hyperlocal functionality in quick commerce. In your case, customer can see any book irrespective of his location right?
Rohidas 07:26 PM	Yes. Okay. How much does this cost?
Bagisto Team 07:30 PM	let me create one revised flow and send to you
Rohidas 07:34 PM	Okay. I just needed to clarify Bagisto's features before moving forward. I will contact you to buy the product once development starts.
Bagisto Team 07:36 PM	Right now this is the default hyperlocal functionality in quick commerce.
Rohidas 07:37 PM	Understood. Give the custom development cost estimation.
SESSION III: CUSTOM FLOW FEASIBILITY & SIGN-OFF (JULY 9 – 11, 2026)	
Bagisto Team July 9 04:00 PM	Hi Rohidas. How are you. For any third party shipping integration, there are three areas we automate via api, fetching shipping rate at checkout, tracking ID generation and label generation. Do you want to automate all of these feature via api or you will be doing it manually from bluedart dashboard?
Rohidas July 9 04:06 PM	I am not sure about this right now. I will discuss these matters with the client once they agree to the project. However, we might need all those features. You haven't shared the cost of custom development yet.

Bagisto Team July 9 09:09 PM	Hi Rohidas, As discussed, please review the proposed workflow document and let us know your feedback or confirmation. Document Reference: https://docs.google.com/document/d/18xMHCbrr0XXkCzvpEPmyjpbcm2vD0KIItTWjU-HZaAE4/edit?usp=sharing Once we receive your confirmation, we will proceed with the effort estimation, project timeline, and commercial quotation.
Rohidas July 10 09:42 AM	Hello Sourav, I have read the document and the proposed workflow is correct, as we expected.
Bagisto Team July 10 07:03 PM	Hi Rohidas, Thank you for confirming that the proposed workflow aligns with your requirements. We have reviewed the feasibility with our technical team. Based on the confirmed scope: Estimated Timeline: 8–10 working days Estimated Development Cost: ₹1,00,000 (excluding GST) Order Fulfillment Flow: • If all products in an order are available at a single stock point, the complete order will be fulfilled from that stock point. • If an order contains products available across multiple stock points, the complete order will be fulfilled from the <i>default inventory (Bengaluru Main Warehouse)</i> to avoid split shipments. Example Execution Scenario: If a customer orders 5 books where 1 book is available in Mysuru, 1 book is available in Udupi, and 3 books are available in the Bengaluru Main Warehouse; in this specific case, the complete order will be fulfilled entirely from the Bengaluru Main Warehouse (Default Inventory) as a single consolidated shipment. If you have any other order fulfillment workflow in mind, please let us know. We will be happy to review its feasibility and discuss the best possible implementation approach.
Rohidas July 11 02:28 PM	Hi Saurav, I have reviewed your estimated timeline and development costs. There are no changes to the workflow for now; I will let you know if anything is required. Thanks, Rohidas.
Bagisto Team July 11 02:45 PM	Sure. Thanx.
